

Chapter 1

1. Controller and endpoints

Create Spring Boot application that handle requests to the endpoints `/index` and `/contact`. Index endpoint returns string 'This is the main page' and contact endpoint returns string 'This is the contact page'.

2. Request parameters

Create Spring Boot application that handle request to the endpoint `/hello`. Application gets two parameters in the request. Parameter names are location and name. The application prints the following text 'Welcome to the (location value) (name value)!'

Example:

Request:

```
http://localhost:8080/hello?location=moon&name=John
```

Prints:

Welcome to the moon John!

3. Git & GitHub

- a.) Read Getting started from the Git documentation (<https://git-scm.com/doc>)
- b.) Go through <https://try.github.io/> tutorial.
- c.) Create an account for GitHub (<https://github.com/>) if you don't already have.
